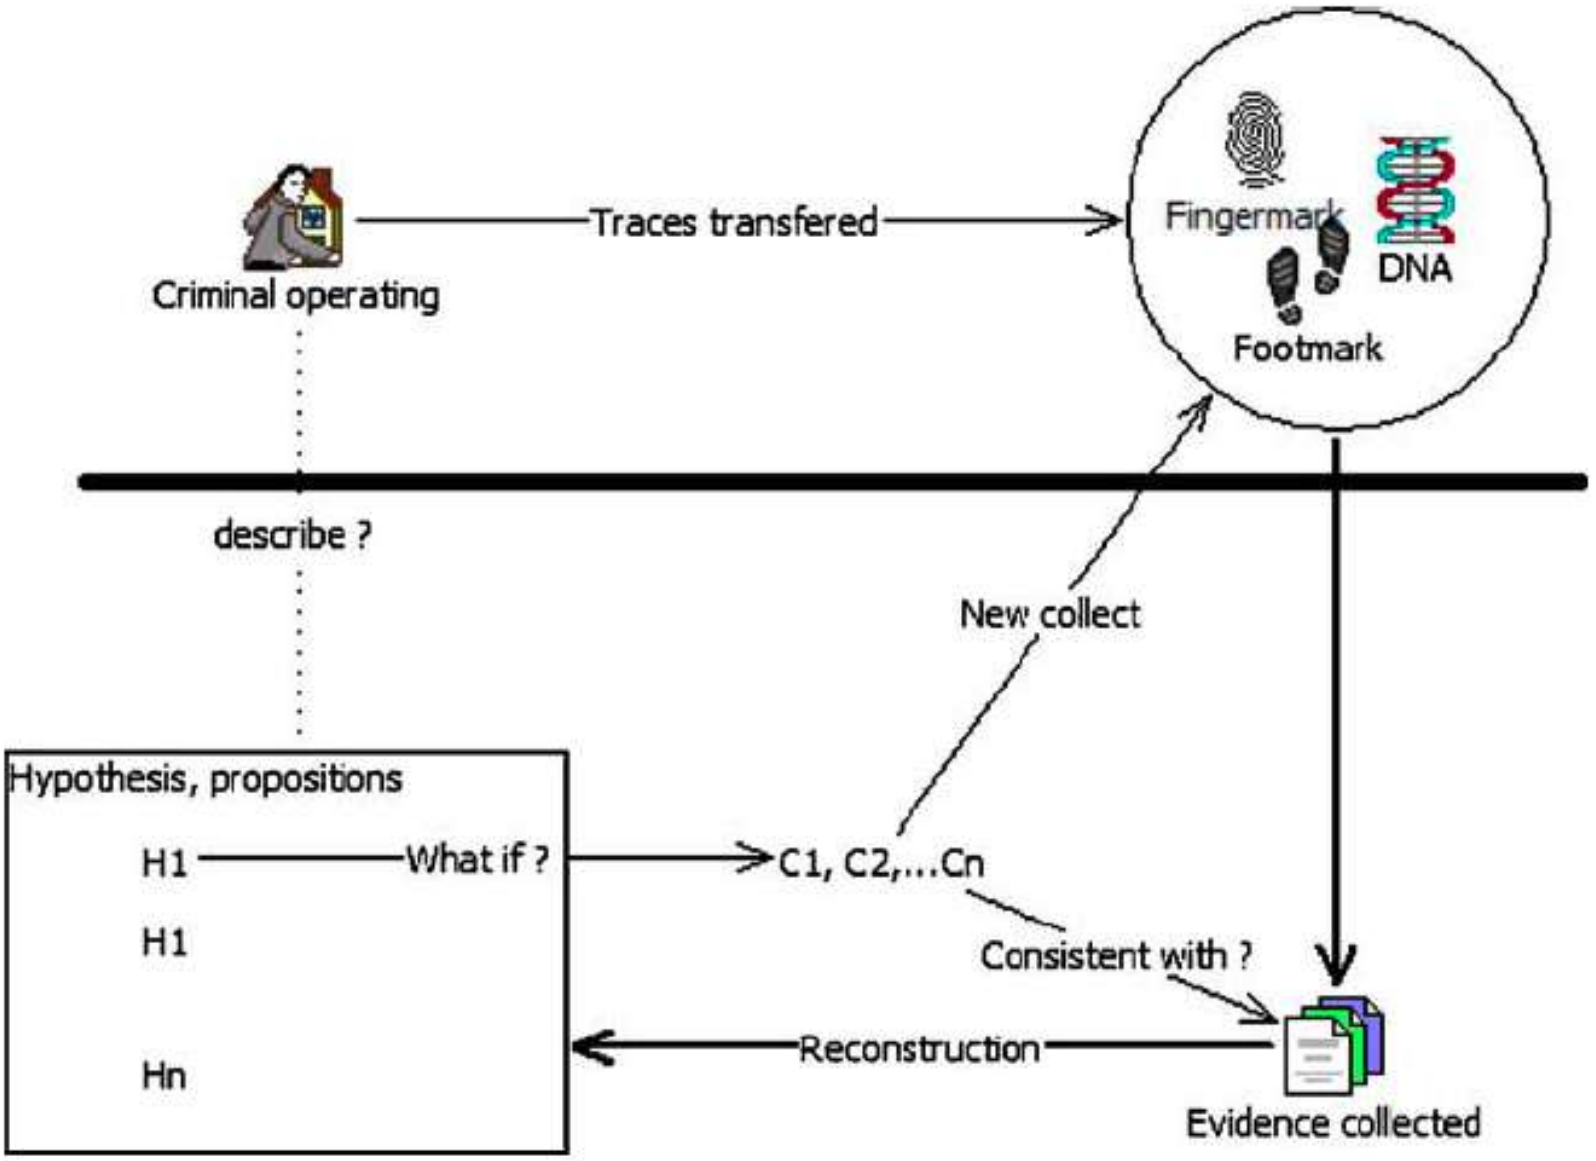
Glitter – The Ideal Trace Evidence?

Richard Kam, Linda Xiao, Xanthe Spindler, Philip Maynard, Claude Roux

Centre for Forensic Science, University of Technology, Sydney, Australia



Ribaux O., Baylon A., Lock E., Delémont, O., Roux C.,., Zingg C., Margot P. Intelligence-led crime scene processing. Intelligence and crime scene. Forensic Science International 199 (2010) 63–716.

UNIVERSITY OF TECHNOLOGY SYDNEY

Introduction

- Glitter is a man-made piece of aluminium foil or plastic that is cut up into tiny individual pieces.
- Cut into shapes such as hexagon, square or rectangle. Some special shapes can also be cut.
- Around for many years but was not used frequently.
- However, in today's society it can be found in a large range of products.
- Recently, it has been involved in criminal cases and has been used as evidence.

Introduction

- Ideal trace evidence:
  - Nearly invisible; glitter is so small, it is hard to see under normal conditions.
  - High probability of transfer and persistence; glitter is small and lightweight.
  - Highly selective; glitter can be categorised into various sub-classes (such as shape, size, thickness, colour, etc.).
  - Quickly and easily collected, separated and concentrated; glitter can be tape lifted and searched with hand held lighting.
  - Easily characterised; similar to “highly selective”.
  - Computerised database capability.

UNIVERSITY OF TECHNOLOGY SYDNEY

Aims

- Characterise and differentiate the glitter products, including within the Australian markets and manufactures.
- Determine the types of techniques to be used for glitter examination with their relative value and limitations.
- Provide information on the brand, country, colour, shape, etc. for the purpose of identification using these techniques.

UNIVERSITY OF TECHNOLOGY SYDNEY

Materials and Methods

Samples

- A total of 239 glitter samples (120 glitter samples provided by Bob Blackledge and purchased in Australia).

Table 3. Country of Manufacture and brand of glitter samples

Brand of Glitter Sample	Country of Manufacture	Number of Glitter Samples	Obtained from
Meadowbrook Inventions	United States of America	120	Bob Blackledge
Celebrations of Australia	United States of America	84	Lincraft
Zing!	United States of America	5	Spotlight
Jones Tones	China	9	Spotlight
Fizz	China	13	Spotlight
Martha Stewart	Korea	3	Spotlight
Unknown from Dollar Shop	Unknown	5	Dollar Shop

UNIVERSITY OF TECHNOLOGY SYDNEY

Materials and Methods

Approach

- Optical examination under low power stereomicroscope.
- Objective colour measurement by microspectrophotometry.
- Comparison microscopy and surface texture.
- Fourier Transform Infrared (FTIR) in Attenuated Total Reflectance (ATR) mode.
- Construction of database using FileMaker Pro 11.
- Blind tests.

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

General

- No glitter samples were found to be manufactured in Australia. Mostly manufactured in United States of America and China.
- Results tabulated into excel based on shape, colour, size and area.
- Assorted into common classes.

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

Figure 1. Number of colours (%) in the glitter samples (the percentage does not add up to 100% because samples had more than one colour in the sample)

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

- Well known limitations associated with colour determination.
- Colour can be affected by different lighting conditions, angle of observation, properties of the various plastic layers and colour shifting effects.
- Common classes or microspectrophotometry.

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

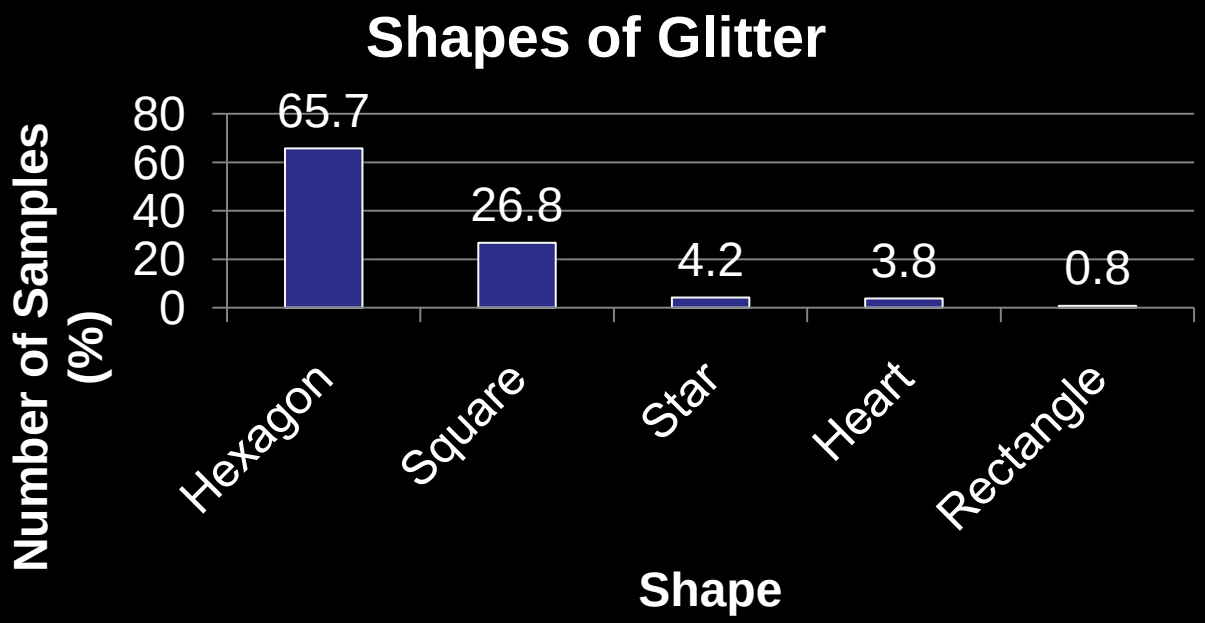

Figure 3. Number of shapes (%) in the glitter samples (the percentage does not add up to 100% because some samples had more than one shape)

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

- Shape only, the hexagon glitter samples would consider to have fairly low evidential value due to its frequent appearance.
  - Confirm studies by Aardahl, 2003; Aardahl et al., 2005 and Kirkowski, 2003.
- Other shapes such as star, heart and rectangle would have better evidential value due to their less frequent appearance.

Aardahl, K. 2003, *Evidential Value of Glitter Particle Trace Evidence*, Master's Thesis, Natioal University, San Diego, CA, USA.
Aardahl et al. 2005, 'A target glitter study', *Science & Justice*, vol. 45, no. 1, pp. 7-12.
Kirkowski, S. 2003, The Forensic Characterization of Cosmetic Glitter Particles, Master's Thesis, National University, San Diego, CA, USA.

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

Figure 4. Top row shows how the size of each type of shape was measured and the bottom row shows how the area of each shape was measured (LAS V3.6 software).

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

Microspectrophotometry

- All the absorbance region followed the optical colour observation.
- Little discrimination within the same colour group.

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

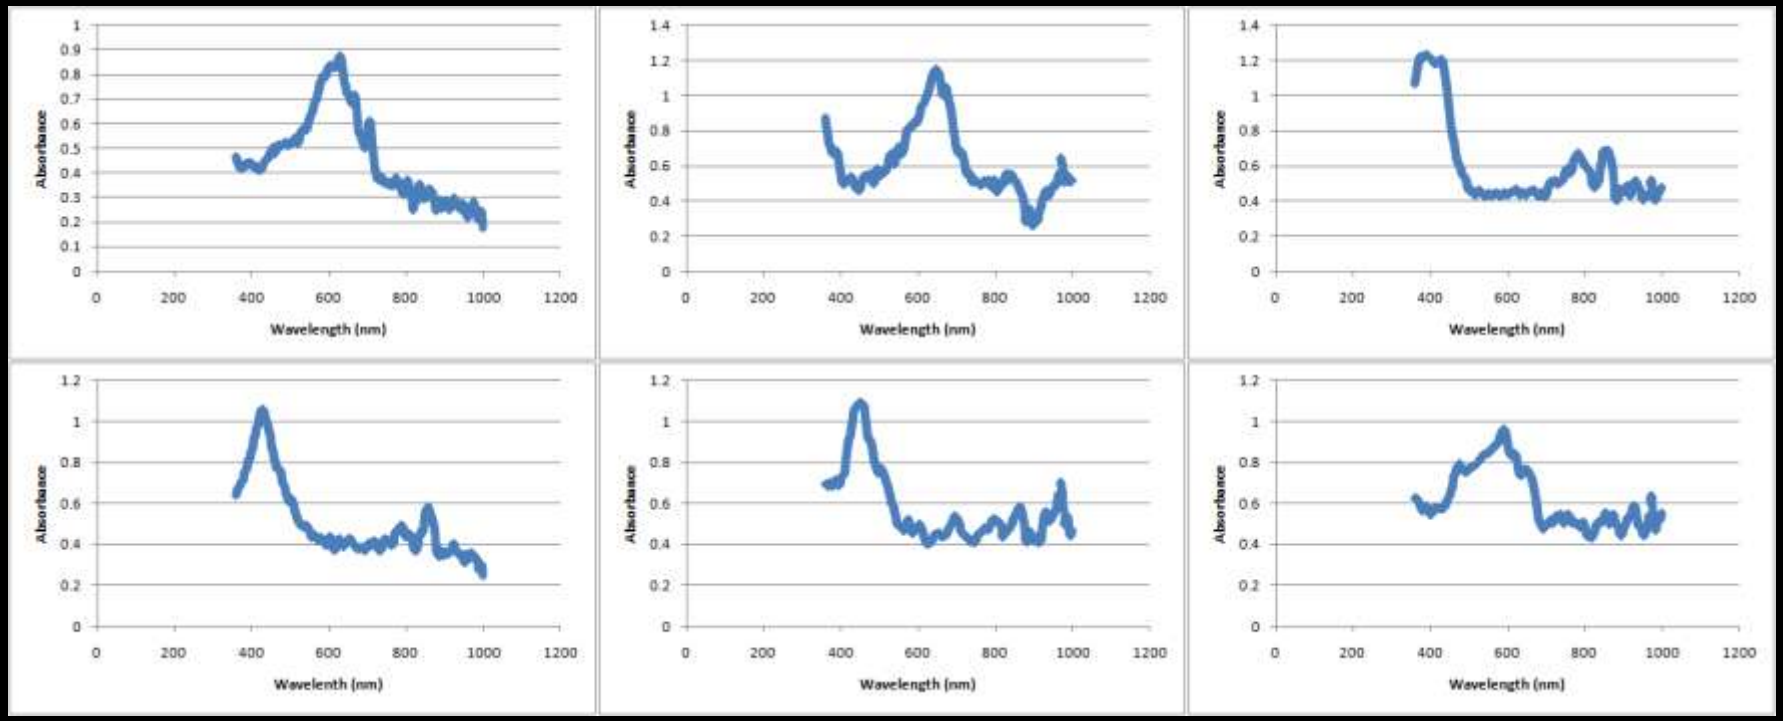

Figure 5. Microspectrophotometry showing that these samples have two different absorbance (Left is C#09, middle C#17 and right is Fizz Crystal #1)

Results & Discussion

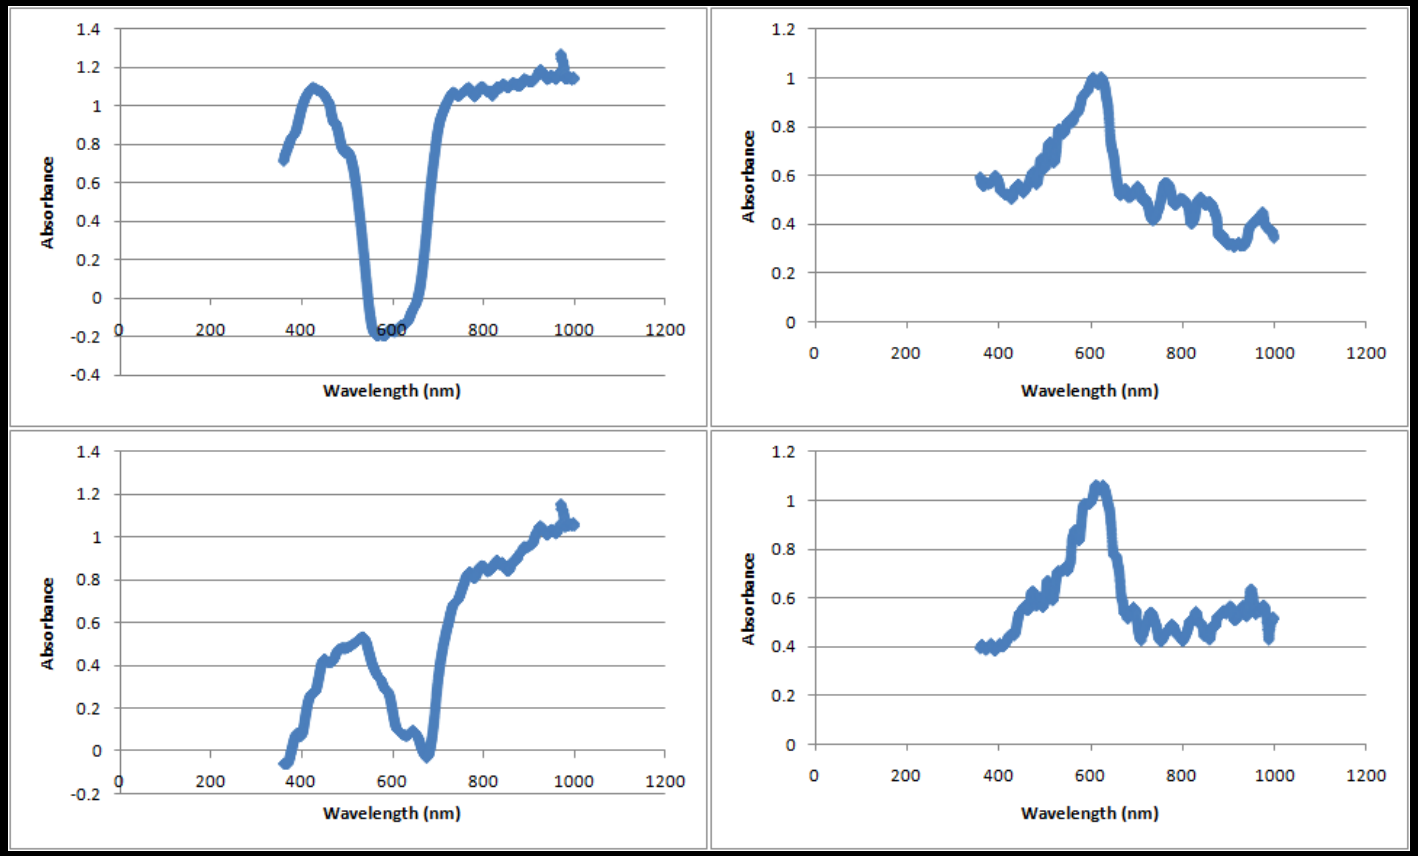

Figure 6. MSP spectra of different blue glitter samples (left top - C#21, left bottom - C#22, right top - C#12 and right bottom - #041)

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

Fourier Transform Infrared (FTIR)

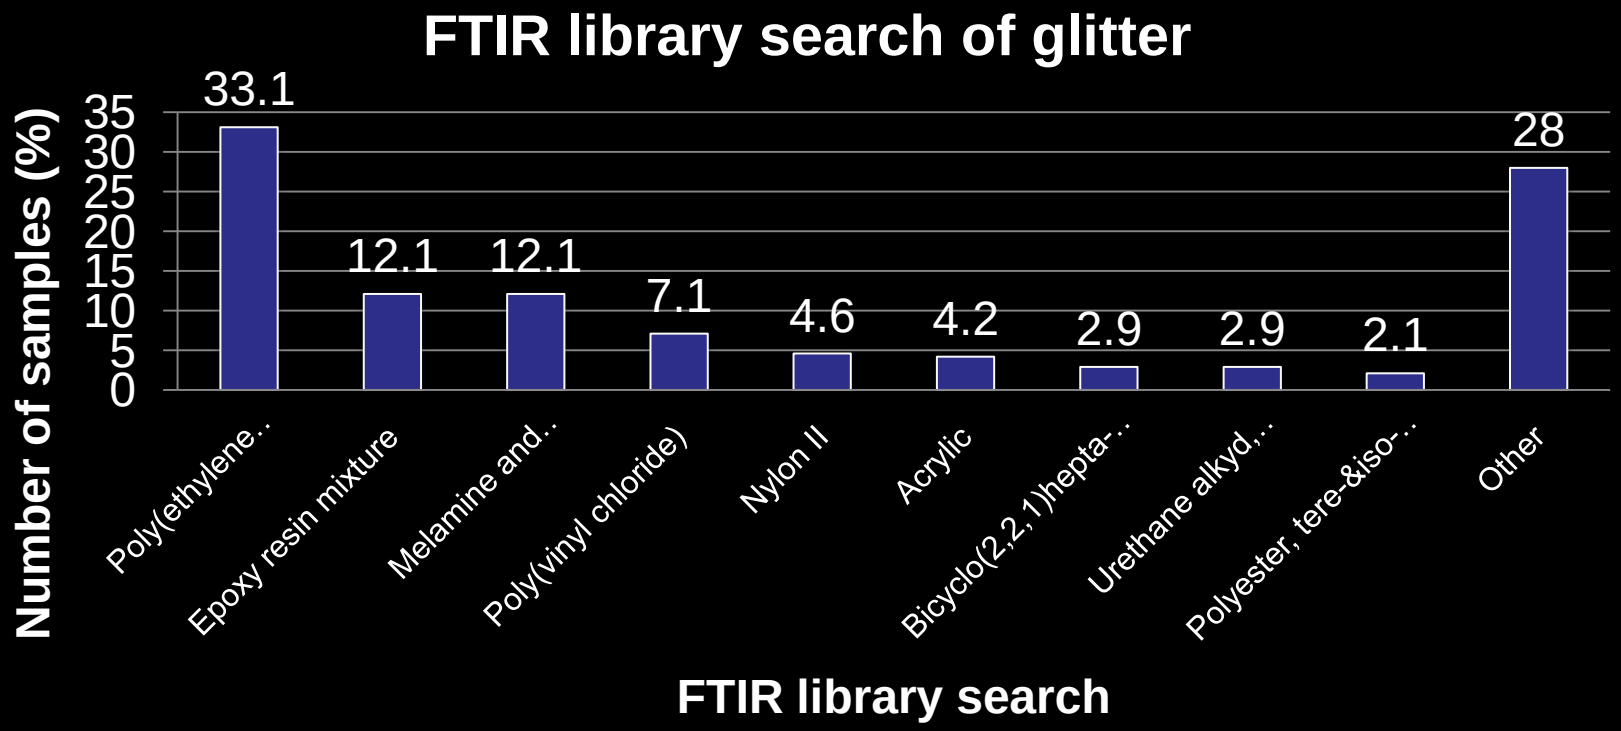

Figure 8. Number of different polymers (%) found by the FTIR library search of each glitter sample (the percentage does not add up to 100% as some samples had more than one substance)

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

- When grouped according to their brand names:
  - Poly(ethylene terephthalate) (PET) - mainly in the American products;
  - Other countries mainly used other polymers (i.e. epoxy resin mixture or melamine and phenolic resin mixture).

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

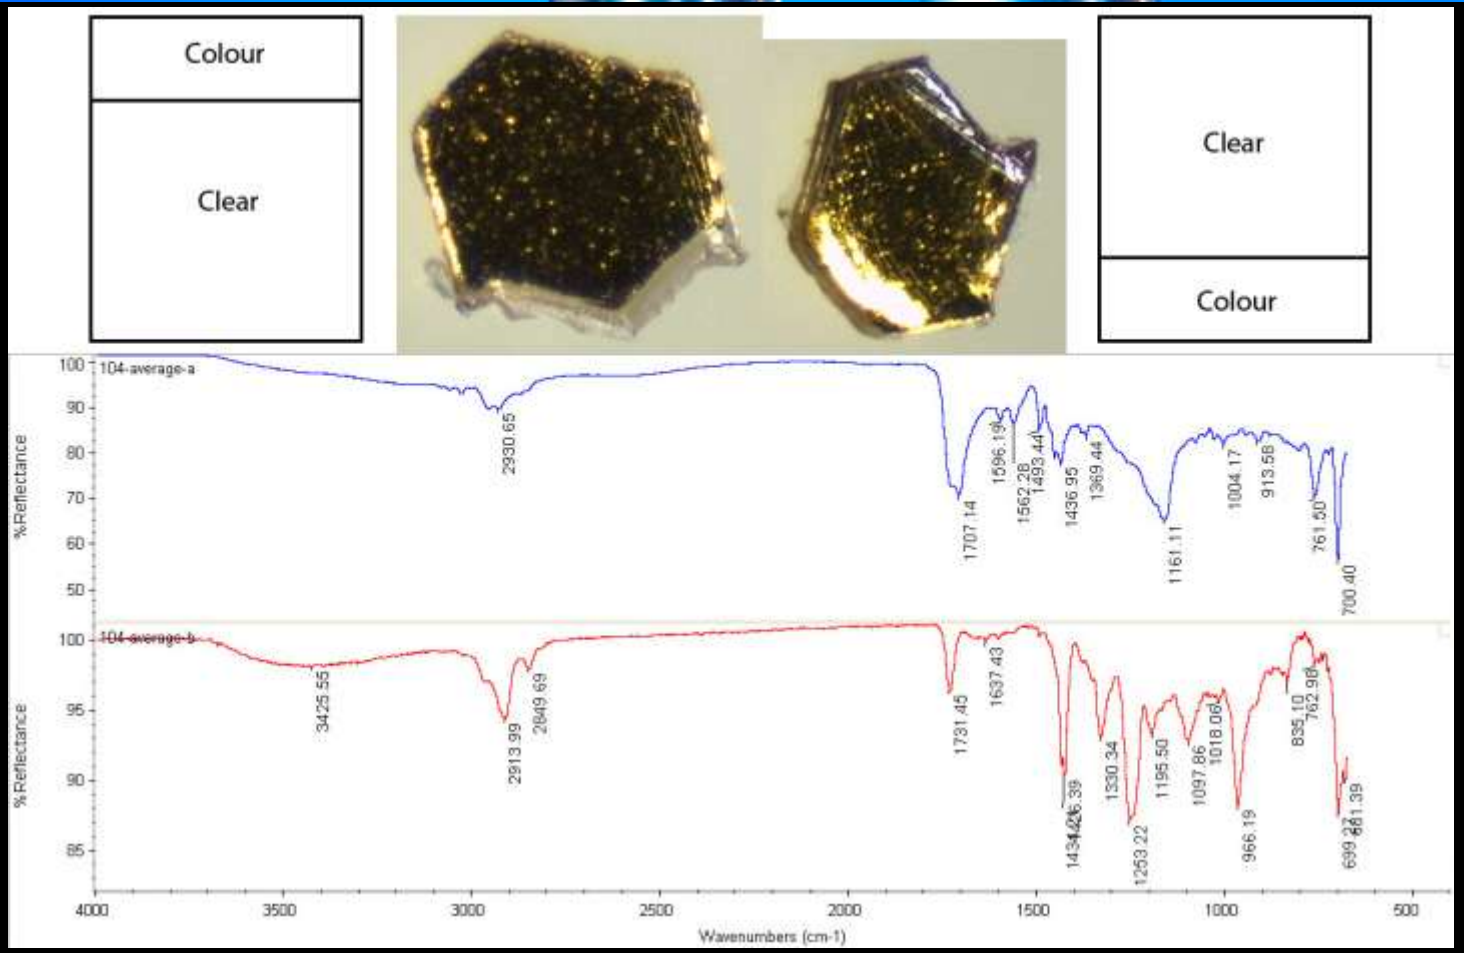

Figure 10. FTIR spectra of #104 glitter sample as analysed on different sides, giving two different spectra

Further Possible Instrumental Analyses

- Raman microspectroscopy, especially for the analysis of the inner layers of the glitter;
- Scanning electron microscopy/Energy dispersive spectroscopy (SEM/EDS) or another elemental analysis;
- Density by Magnetic Levitation:
  - 11 glitter samples classified in 3 categories (Lockett et al, submitted to JFS)

Results & Discussion

Database

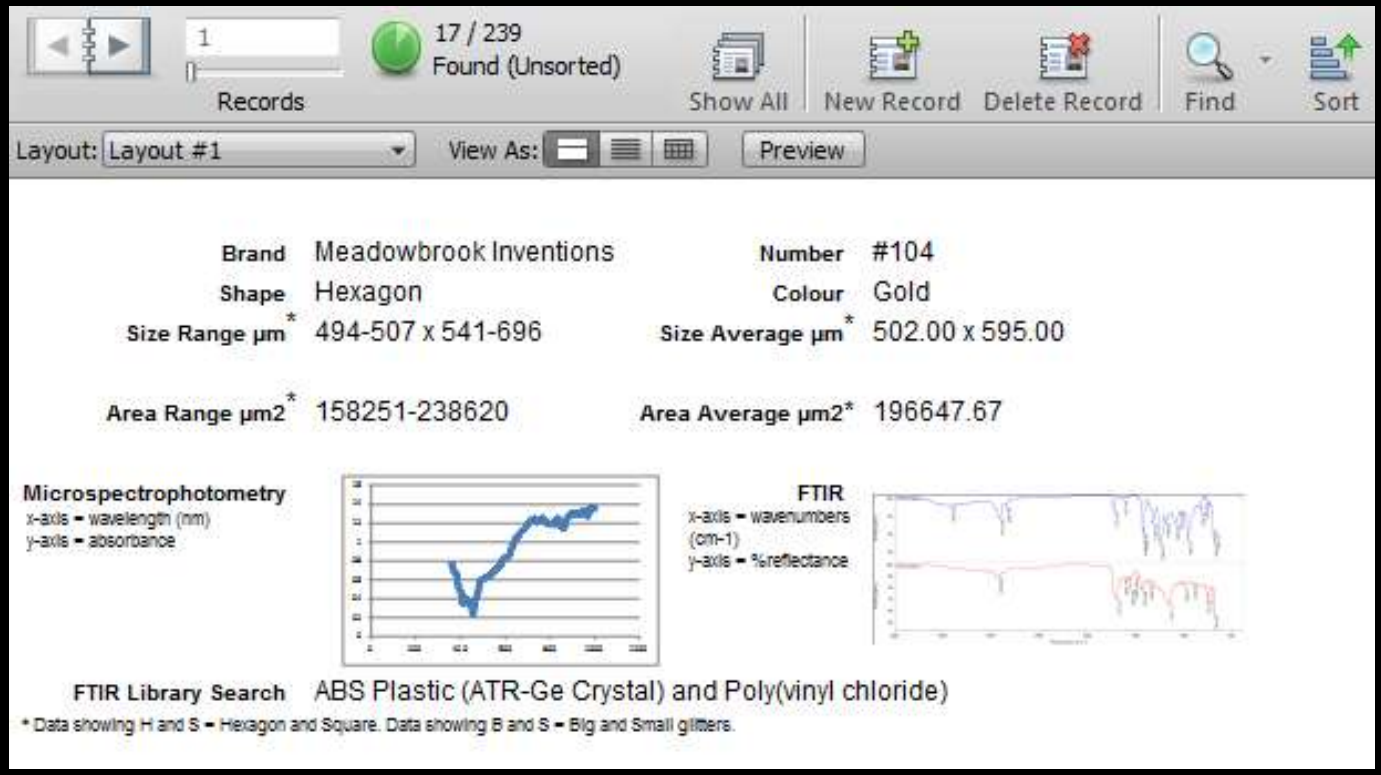

Figure 11. Layout of Database

UNIVERSITY OF TECHNOLOGY SYDNEY

Results & Discussion

Blind Test

- Carried out to test the accuracy of the database constructed.

Blind Test	Result Obtained	Correct Result
#1	C#21	C#21
#2	#074	#074
#3	#137	#137
#4	Fizz Crystal #9	Fizz Crystal #9
#5	JT#6	JT#6
#6	C#17	C#17
#7	JT#3	JT#3
#8	#055	#055
#9	C#22	C#22
#10	JT#2	JT#2
#11	Fizz Crystal #12	Fizz Crystal #12
#12	#046	#046
#13	JT#1	JT#1
#14	C#01	C#01
#15	#132	#132

Recommended Sequence

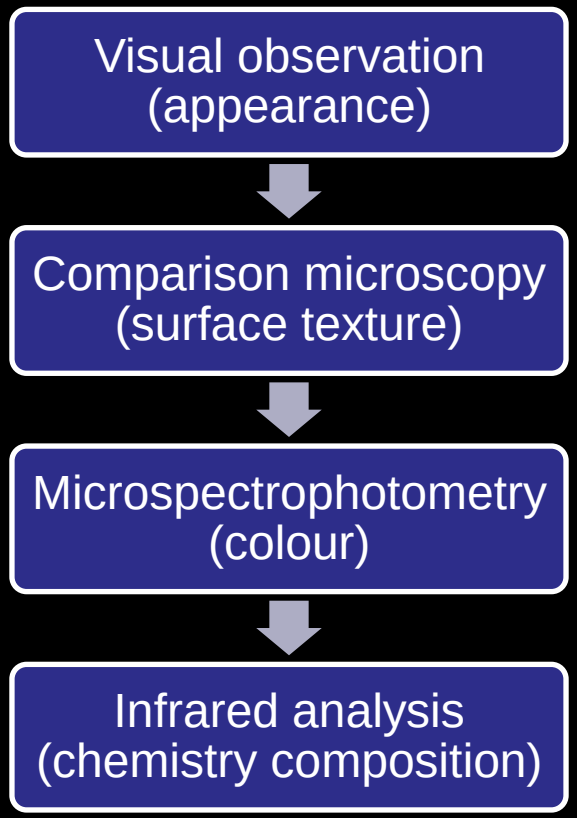

Figure 13. Sequence of approach for glitter analysis

UNIVERSITY OF TECHNOLOGY SYDNEY

Conclusion

- Variety of brands of glitter were characterised via optical, physical and chemical techniques.
- Microspectrophotometry was used to give an colour objective measurement for better comparative result.
- FTIR was the most discriminating technique due to its chemical composition analysis.
- Blind test were identified correctly with the help of the constructed database.

Recommendation

- Further development of the database, including addition of information regarding:
  - A layers section;
  - A specific gravity section;
  - Raman microscopy;
  - SEM/EDS.
- Transfer, persistence and prevalence experiments.

UNIVERSITY OF TECHNOLOGY SYDNEY

Acknownledgement

- Bob Blackledge for providing some of the samples and general advice .

Australian and New Zealand
FORENSIC SCIENCE SOCIETY

21st International Symposium on the Forensic Sciences

Convicts to Criminalistics: Past, Present and Future

Invitation to Attend

The Australian and New Zealand Forensic Science Society invite you to attend the 21st International Symposium on the Forensic Sciences in Hobart from 23 to 27 September 2012.

Join us in the picturesque island state of Tasmania to hear national and international leaders in forensic science speak on a diverse range of topics, to participate in an exciting social program and to enjoy the best in fine Tasmanian food and wine.

Whether you are a student, forensic practitioner, supervisor or manager working in any of the forensic disciplines, the Hobart symposium will offer an enriching and memorable experience for all delegates.

Of course, no visit to Tasmania would be complete without visiting some of the island's iconic natural and historic attractions such as Cradle Mountain, Port Arthur or Wineglass Bay. Consider spending some extra time to see what a well kept secret Tasmania really is!

Visit the website for more information and to register your interest.
